Residents' Emergency Response Checklist

A helpful guide in the event of extreme weather or fire events

Cloverton

Residents' Emergency Response Checklist

The safety of residents is very important to Stockland. As part of the masterplan for the Cloverton development, an assessment has been completed to identify potential extreme weather and fire events.

Community and Climate Overview

Cloverton is a Stockland masterplanned community located in Kalkallo within the City of Hume, around 38 kilometres north of Melbourne, Victoria.

The new community will be home to over 30,000 residents over the next 30 years. The development will contain 10,963 residential lots, plus a 52 hectare city centre including provision for a large regional shopping centre, neighbourhood centres and retirement living, as well as schools, healthcare, childcare and other community facilities.

Local climate for the Melbourne region is predominantly temperate, influenced by proximity to the coastline and the regular occurrence of cold fronts and low pressure systems.

Average summer temperatures range from a minimum 10.2°C to maximum 25°C with the hottest days typically occurring in January.

Average winter temperatures range from a minimum of 4°C to maximum 10.6°C with the coolest days typically occurring in July.

Extreme temperatures above 35°C can be experienced in summer and can create ideal conditions for bushfires, which are a natural occurrence throughout Australia. Melbourne currently experiences an average of 11 days per year above 35°C. Rainfall patterns for the region are fairly uniform across all months of the year, although trends indicate a high variability of rainfall from year to year.

Specific climate factors

There are several climate factors that Cloverton community residents should be aware of, so as to be better prepared in the event of an extreme weather event:

- The location of the community is currently mapped in a designated bushfire prone area, with areas of grassland susceptible to bushfire
- The location of the community in proximity to Merri Creek, which runs along the eastern side of the development and is flood prone, however the Cloverton development has been designed to withstand a 1:100 year flood and includes flood mitigation features such as retention basins and constructed wetlands
- Projections indicate a significant increase in extreme heat events over 35°C, increasing the risk of heat stress and fire weather days
- Increased intensity of rainfall events that potentially pose access and egress risks (road closures) as well as drainage capacity issues

Regional climate resources

Extreme heat

The VIC Emergency website provides information on planning for and helping others affected by extreme heat

<http://bit.ly/2h2BEGO>

Hume City Council provides advice on how to prepare for a heatwave, with strategies for coping during periods of prolonged heat

<http://bit.ly/2xstK05>

Bushfire

The Country Fire Authority (CFA) website provides information on current fire danger ratings, total fire ban declarations and fire restrictions. Kalkallo and the City of Hume are located within the Central Fire District:

<http://bit.ly/1KF9wNJ>

The CFA website also provides information for community bushfire planning and preparedness, with assistance and resources for what to do before and during a bushfire. The website also provides information on Community Fire Refuges (enclosed buildings that can withstand fire) and Neighbourhood Safer Places (open air spaces such as sporting fields):

<http://bit.ly/2mOmAwu>

Hume City Council recommends residents have a Bushfire Survival Plan and have implemented the Hume City Municipal Fire Management Plan 2013-2016, available at:
